ABSTRACT

In a display device having a display region formed by disposing a plurality of organic light emitting elements such as organic EL elements, it 5 becomes possible to prevent penetration of water into the display region to suppress degradation in display characteristics even during drive over a long period of time and to improve long-term reliability. is provided a display device comprising a display 10 region 120 having a plurality of organic light emitting elements disposed on a substrate 101, each of the plurality of organic light emitting elements having an organic layer 103 comprising a light emitting layer interposed between an anode and a 15 cathode (102, 104), wherein the display region 120 is formed on a first insulating protective layer 106 provided on the substrate 101, and a surface on a side opposite to a substrate 101 side and an entire periphery of the display region 120 are covered with 20 an insulating protective film 107.
